

### Ice Breaker EF 1500

- The ice breaker is mounted on the front of the Multihog, and roughens/breaks up hard, packed snow.
- The cut and softened material then settles firmly on the ground, increasing the friction of the surface.
- It is commonly used in locations with harsh winter climates (e.g. ski resort roads and paths).
- Designed to run at minimal engine speed to achieve lowest possible noise and emissions pollution.
- The cutting depth can be set as desired.
- The pivoting frame can be adapted to match the road surface.
- The rear spreader bar distributes the broken snow material evenly.
- Total width is 1520 mm (60 in), working width is 1385 mm (55 in).
- Ideal for facilities maintenance firms, municipalities and contractors.

*Due to our policy of continuous improvement, specifications may change subsequent to publication of this sheet.*
